

## ONSERT®

The Bollhoff® ONSERT® is used when fasteners are mounted to non-weldable materials or materials that you cannot access the backside. This innovative technology offers best conditions for versatile use in different segments. The ONSERT® also features a propriety method of cleanly removing the fastener and residual adhesive when the fastener is no longer needed or needs replacement.

### Features & Benefits

---

Full mechanical load capacity immediately after adhesion is complete

Short cure time (<4 seconds)

No penetration or protrusion into parent application

All of the ONSERT® fastener lines can be provided in any geometry which can be produced by injection molding equipment.

The fastener element is combined into a base of transparent plastic, which is then bonded to the parent application using a light-curing adhesive.
